

Pigment granules

Abstract

5

Pigment granules having an average particle size from 50 to 5000 μm and a BET surface area $\leq 15 \text{ m}^2/\text{g}$, including as essential constituents

10 (A) from 60 to 90% by weight of at least one pigment and

(B) from 10 to 40% by weight of at least one nonionic surface-active additive based on polyethers,

15 are prepared and used for pigmenting macromolecular organic and inorganic materials.
